

You keep Claude in one tab. **It runs the other nine.**

Connect your apps once. From one chat Claude searches, enriches, emails, books and charges, and **asks before anything irreversible ships.**

SWIPE TO SEE HOW →

It was never a tool problem. It was a tab problem.

Every app did its job. **You were the integration layer**, copy-pasting between nine tabs all day, dropping a lead on every handoff.

your-stack · 9 tabs open

You were the glue. Nine tabs, every handoff a place to drop the ball.

CONNECT ONCE

03 / 05

Point Claude at the apps **you already pay for.**

It only ever fires the ones you connect, so it never reaches into an app you do not run.

WAITING FOR YOUR YES

Approve

Stop being your own **integration layer.**

One operator, every app, one approval gate on anything that ships. That is the line between a chatbot and an operator.

9 tabs collapse into one chat

1 approval gate on every send

0 copy-paste handoffs left

Comment **STACK** and I send you the operator map
