

CLAUDE PROJECTS · A FOUNDER SETUP

How to set up Claude Projects like an operator

Stop re-explaining your business in every chat. A Project gives the AI **memory**, a **workspace** and **scope** that carry across every task.

Memory

remembers past tasks

Workspace

files + rules in one place

Execution

acts on files, scheduled

Scoped

workstreams stay separate

SWIPE TO SET UP →

WHY USE PROJECTS

One place that remembers **everything**.

A chat forgets the moment you close it. A Project keeps the context, so the work compounds instead of resetting.

Memory

Claude remembers what happened in **previous tasks** inside the project.

Workspace

Instructions, files and outputs live **together in one place**.

Execution

Cowork projects **act on your files** and support scheduled tasks.

Scoped context

Memory stays inside the project, so **workstreams stay separate**.

THE SETUP

Five steps from empty to **running**.

You set it up once. After that the Project gets sharper every time you use it.

SET UP A PROJECT

~10 MIN, ONCE

1

Create a project

Start from scratch, **import a chat**, or point it at an existing folder.

2

Add instructions

The goal, your terminology, the framework and the **rules it must follow**.

3

Add context

Reference docs, transcripts, PDFs and **folders it can work from**.

4

Run work inside it

It builds **project-scoped memory** and applies the lesson next time.

5

Stack it with Skills

The Project holds context. **Skills handle the repeatable tasks**.

WHAT IT LOOKS LIKE

A workspace, not a **blank chat**.

Here is a founder Project running GTM. Instructions, context and memory, all scoped to one workstream.

Q3 Outbound · US / UK

MEMORY: 42 runs

INSTRUCTIONS

Goal: book 20 founder calls
ICP: 2-50 people, IT/SaaS
Voice: operator, no fluff
Cadence: Tue and Thu, 10:00

PROJECT MEMORY

"Series B angle" booked 3 calls
subject over 6 words = ignored
Tuesday 10:00 = best open rate
break-up line beats a 4th nudge

CONTEXT IT WORKS FROM

/reference

/analysis

/deliverables

icp.csv

call-notes.pdf

pricing.md

PROJECTS VS SKILLS

Two tools. Different **jobs**.

People mix these up and then wonder why nothing sticks.
The split is simple.

SKILL

A recipe

for a repeatable task. Same steps, same output, every run.

e.g. cold-email, ICP score

PROJECT

A workspace

for ongoing work. Holds the memory of what came before.

e.g. Q3 Outbound, one client

- ✓ Use a **Project** when the work needs memory of what came before.
- ✓ Reach for a **Skill** when you repeat the same task and want one fixed output.
- ✓ The best setups **stack both** : Skills run the reps inside a Project that remembers.

WHEN TO USE WHICH

Chat, Project, or **Skill**?

One quick rule for each, so you stop forcing every job into a fresh chat.

CHAT

Thinking

A one-off question. **Nothing to remember** after.

e.g. a quick fact-check

PROJECT

Doing

Ongoing work that **compounds**. A client, a quarter, a campaign.

e.g. Q3 outbound, one client

SKILL

Repeating

The same task again. **One fixed output** every time.

e.g. cold-email, ICP score

A simple folder structure carries it: **/reference** · **/analysis** · **/deliverables**.

Stop starting over. Set it up **once.**

A Project turns Claude from a blank chat into **a workspace that remembers your business.** That is where an operator runs GTM.

THE 5-STEP SETUP

- 1 Create the project
- 2 Add instructions and **rules**
- 3 Add context: docs, folders, **PDFs**
- 4 Run work so it builds **memory**
- 5 Stack it with **Skills**
