

the wrong question is everywhere

Which AI tool should I use *is* *not the point*

WHY IT WORKS

The winners are not picking better tools. They are building *pipelines* where one agent coordinates many models.

01

HIGHSFIELD SIGNAL

The market already chose *for us*

Higgsfield.ai proves demand is exploding, but the real lesson is how the system is built.

```
// // demand is already validated  
build scale("now");
```

Huge valuation

Higgsfield reportedly reached \$1.3B with massive annualized revenue.

\$1.3B

Massive usage

It has 25M users generating real volume, not toy experiments.

25M

Video model stack

It aggregates 30+ models, including Sora 2, Kling 3.0, and Veo 3.1.

30+

02 THE REAL SHIFT

One agent directs *many* execute

Claude is not the star tool. Claude is the conductor using MCP to coordinate the whole workflow.

```
// // orchestration beats selection
import orchestrate("mcp");
```

Claude decides

It chooses the next step and passes work to the right model.

1→N

Models execute

Specialized tools handle image, video, reasoning, or formatting tasks.

N tools

Better output

The combined result is often 100x stronger than manual prompting.

100x

M

03 WHO ACTUALLY WINS

The users reveal *the buyer*

85% of Higgsfield users are social media marketers, but the bigger opportunity sits with SaaS founders.

```
// // audience is not strategy  
watch segment("founders");
```

Marketer demand

Social teams adopt fast because content volume is immediately useful.

85%

SaaS lesson

Builders should see the system, then apply it to operations and revenue.

B2B

Faster output

Pipelines turn a scattered process into a repeatable advantage.

repeatable

04

COMPETITIVE EDGE

Tools are commoditizing *pipelines* *are not*

Any founder can buy the same model access. Few can design a

```
// // choice is no longer moat  
replace differentiate("workflow");
```

Same tools

Everyone can access similar models, APIs, and generators.

0 moat

Different flow

Your process determines speed, quality, and consistency.

compounding

Bigger moat

System design becomes harder to copy than app choice.

harder

05 THE ORCHESTRATION RULE

Build the pipeline *not the prompt*

Start with a process, wire in Claude, then connect the best model for each step.

```
// // pipeline first, tool second  
connect compose("steps");
```

Map the process

Pick one repeated workflow with clear inputs and outputs.

1 process

Assign agents

Let Claude route tasks instead of forcing one model to do everything.

multi-agent

Measure lift

Track speed, quality, and throughput to prove the pipeline wins.

+speed

M

06 THE END GAME AI pipelines eat *tool buyers*

Companies building pipelines will compound faster than companies just collecting subscriptions.

```
// // systems win over shopping  
ship win("daily");
```

Buyers compare

Tool shoppers stay stuck evaluating features and pricing.

slow

Builders compound

Pipeline builders improve every day as the system learns.

compounding

Moat expands

Execution depth becomes the real competitive advantage.

moat

COMMENT

your move, builder

Wire one process into **AI** *this* *week*

What is the first process in your company you would wire into an AI pipeline? Drop it in the comments.
