

MEMORY

IT STOPS FORGETTING.

Most AI starts every conversation from nothing. *This one opens knowing who you are and what is still open.*

0

TIMES YOU RE EXPLAINPER TURN

THE BLANK PAGE TAX

What re-explaining costs, on either side of memory.

WITHOUT MEMORY

every turn

- paste who you are, again
- paste what you are building, again
- paste last week's notes, again
- the model skims and forgets

WITH THE BRAIN

once

- profile stitched in automatically
- saved facts carried forward
- open work still open
- it either knows or it asks once

THE CHANGE

context stops being retyped

WHAT IT STORES

Three kinds of memory, doing three different jobs.

- 01

Profile

who you are, what you sell, who you sell it to

STATIC
- 02

Saved facts

the things you told it once and never again

DURABLE
- 03

Open work

what is unfinished and what it is waiting on

LIVE
- 04

Session history

searchable, forkable, resumable from the sidebar

THREAD

HYBRID RETRIEVAL

Three signals decide what gets pulled into a turn, not one.

Semantic match
WHAT THE TURN IS ABOUT

Recency
WHAT YOU TOUCHED LAST

Explicit saves
WHAT YOU TOLD IT TO KEEP

WHY THREE one signal returns the wrong memory confidently

WHAT LANDS IN THE **TURN**

Memory is not a database call. It is a block stitched into the prompt.

Three signals run in parallel

PULL

semantic, recent and explicitly saved

Kept short on purpose

RANK

a long memory block crowds out the actual question

Injected before the agent answers

STITCH

so it never opens on a blank page

The turn writes back

WRITE

what it learned is there for the next one

COMMENT

BRAIN

and I will send you how the memory layer is wired.

- 01

Profile, facts and open work
- 02

Three retrieval signals, not one
- 03

Every turn writes back

WHERE IT LIVES
