

SESSIONS

PICK IT UP WHERE YOU DROPPED IT.

Most AI forgets the moment you close the tab. *A session is a place you can leave and return to.*

RESTARTS FROM

A BLANK PAGE

WHAT A SESSION **KEEPS**

Not a transcript. A working state.

01

The thread

searchable in the sidebar, months later

HISTORY

02

The memory

profile and saved facts already stitched in

BRAIN

03

The open work

what was unfinished and what it was waiting on

STATE

04

The files

everything attached is still attached

FILES

RESUME, FORK, HAND OVER

Three things a thread should do and most cannot.

- 

Open it a week later

it opens where you stopped, not where it started

RESUME
- 

Branch one thread into two

try the other approach without losing the first

FORK
- 

Hand the whole thing over

a read only link, context included

SHARE
- 

Find the one you need

across every session, by what was said in it

SEARCH

CHAT VS SESSION

Why the distinction is not pedantic.

A CHAT

disposable

- ends when the tab closes
- starts from nothing next time
- cannot be branched
- cannot be handed to anyone

A SESSION

a place

- persists and stays searchable
- resumes with its state intact
- forks without losing the original
- shares read only, context included

THE TEST

can you leave and come back

WHAT THIS CHANGES AT 8 PEOPLE

The founder-scale version, not the enterprise one.

MONDAY

The deal thread

open it Friday and it still knows the objection

HANDOVER

Onboarding a hire

send the session, not a folder of documents

BRANCH

Two pricing models

fork the thread, run both, keep the winner

RECALL

What did we decide

search the sessions, not your memory

COMMENT

CONTEXT

and I will send you how sessions and resume are wired.

01 Threads persist and stay searchable

02 Fork without losing the original

03 Hand over read only, context included

WHERE IT LIVES
