

THE AI-NATIVE INDEX

MOST FOUNDERS SCORE LOWER THAN THEY THINK.

Not how many AI tools you pay for. How much of the work actually runs through them. *Those are different numbers.*

THE FIVE DIMENSIONS

Scored on what runs, not on what is installed.

01	Routing does the job pick its own model, or do you	SYSTEM
02	Memory does context survive the tab, or get retyped	BRAIN
03	Autonomy does it finish unattended, or need you present	JOB
04	Verification does it check its own output, or hand you homework	PROOF
05	Governance is there a gate, or does it just send	GATE

WHERE MOST FOUNDERS LAND

The pattern under the self-assessments, not a promise about you.

Tools bought
SUBSCRIPTIONS ON
THE CARD

Work routed
JOBS THAT
ACTUALLY RUN
THROUGH THEM

Context kept
SURVIVES CLOSING
THE TAB

Output verified
CHECKED BEFORE
YOU SEE IT

THE GAP spend is not adoption

TOOL STACK VS SYSTEM

Why the first number keeps rising and the second does not.

A STACK

subscriptions

- you choose the tool every time
- context lives in whichever tab
- output arrives as a suggestion
- the bill grows, the work does not

A SYSTEM

routing

- the job picks its own model
- context is underneath all of it
- output is verified before you see it
- one gate, held by you

THE HONEST READ

most stacks score under 40

WHAT MOVES THE SCORE

In the order that actually pays, cheapest first.

FIRST

Stop choosing models

routing is the single biggest jump and the easiest

SECOND

Put memory underneath

stop paying the blank page tax on every turn

THIRD

Make it verify

output you still have to check is not finished work

FOURTH

Hold the gate

governance is the one nobody builds and everyone needs

COMMENT

INDEX

and I will send you the five dimension scorecard.

01 Five dimensions, scored on what runs

02 Spend is not adoption

03 Routing is the cheapest jump
